Introduction to Problem 1:

In problem 2, we were tasked with writing a python function that will take a word document, namely words.txt, which counts the amount of unique characters within the text document. Using this data, we had to store the data into an array and use this array to form a graph that represents our findings, the quantity of letters that were within the words.txt file.

Results:
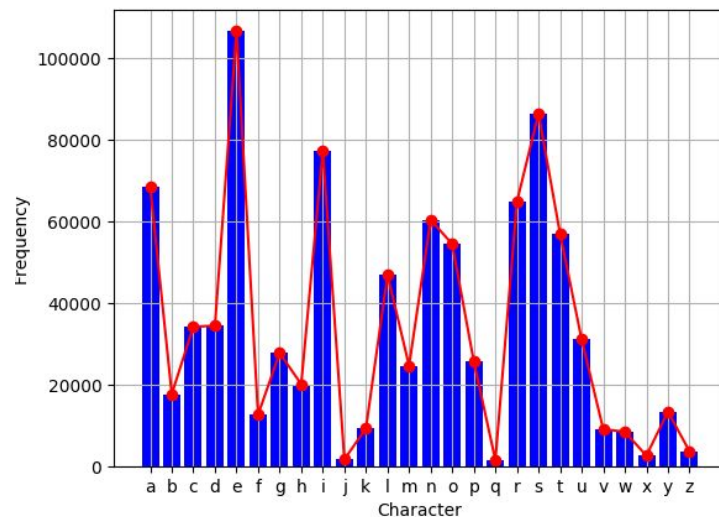

How to Run: Via terminal: Enter "python3 plotter_prob1.py." This will execute our python code and will launch that graph shown above. This image will save to our /hw6/Prob1/code directory once the graph is closed from viewing.
